

Project Development

Application using Gemini Models

Date	
Team ID	6aba07eeb2817f097462be97
Project Name	FitBuddy – AI Fitness Plan Generator using Gemini Models
Minimum Marks	

AI – Powered Application Development:

The FitBuddy application is built by integrating Gemini models with a fitness-focused web interface. The system interprets the user's fitness requirements and generates relevant workout suggestions through AI. The application is designed to present the generated information in a clear and organized manner, making it easier for users to follow their fitness routine. The development also focuses on smooth interaction, quick AI responses, and a simple experience for users with different fitness needs. A simple and responsive interface makes FitBuddy easy to use across different devices.

The underlying software architecture establishes a seamless asynchronous pipeline where client-side requests are securely processed through backend API controllers that manage prompt construction, API rate limiting, and response parsing.

Performance optimization focuses on minimizing latency during model generation, ensuring that users receive their custom workout splits and real-time exercise alternatives within seconds on both desktop and mobile viewports.

FitBuddy Application Workflow:

Building the Actual FitBuddy Application Using Gemini Models

The FitBuddy application is developed as an AI-powered fitness assistant that uses Gemini models to create personalized fitness plans. The application collects user details, processes them with the Gemini model, and delivers custom workout recommendations, tracks progress, and allows users to update their goals and preferences.

How It Works

- 1 User Input**
The user fills in their details like goals, fitness level, preferences and available time.
- 2 Process with Gemini**
The input is sent to Gemini models, which analyze the information and generate a personalized fitness plan.
- 3 Display & Track**
The app shows the plan, workout videos, and lets users mark completed workouts and track progress.
- 4 Update & Regenerate**
Users can update their preferences anytime and regenerate a new plan.
