Project Documentation & Report Management

Date	
Team ID	6aba07eeb2817f097462be97
Project Name	FitBuddy – AI Fitness Plan Generator using Gemini Models
Minimum Marks	

Documentation Preparation & Management:

Project documentation helps maintain a clear and organized record of the FitBuddy development process. The team prepares documents covering the project objectives, system design, development activities, testing results, and final outcomes. These records help the team communicate important information, track project progress, and explain how the application was developed. Proper documentation also makes it easier to understand the system and support future improvements or maintenance.

Structuring comprehensive technical documentation for FitBuddy involves establishing clear sections for system architecture, API endpoint specifications, and database schema diagrams to ensure maintainability and smooth handoffs during project reviews.

Project management tracking relies on maintaining updated requirement specification documents, user story logs, and task allocation matrices to align development milestones with AI integration deliverables.

User-facing documentation includes concise onboarding guides, feature walkthroughs, and troubleshooting FAQs designed to help individuals navigate the AI-generated fitness routines efficiently.

Types of FitBuddy Project Documents:

Preparing the Necessary Reports and Project Documents

Project documentation plays an important role in the FitBuddy project as it helps keep a clear record of the work done, decisions made and progress achieved. The team prepares essential documents such as the project plan, technical specifications, user manual, test reports and final presentation. These documents are useful for tracking development, sharing information with stakeholders and supporting future updates or maintenance. Proper documentation ensures the project is well organized, easy to understand and successfully completed.
