

Project Testing

Application Testing and Error Resolution

Date	
Team ID	6aba07eeb2817f097462be97
Project Name	FitBuddy – AI Fitness Plan Generator using Gemini Models
Minimum Marks	

Application Verification & Error Handling:

Project testing is carried out to make sure that FitBuddy performs correctly and provides the expected results. Each major feature is checked individually, including user input, Gemini-based plan generation, workout display, and progress updates. The application is tested under different conditions to identify incorrect outputs, interface issues, or unexpected errors. Any problems found during testing are corrected and tested again to confirm the fix. This process helps improve the accuracy, reliability, performance, and overall user experience of FitBuddy before the final release.

Testing Workflow:

Checking Whether the Application Works Correctly and Fixing Errors

Project testing is an important stage in the FitBuddy development process. It ensures that the application works as expected and meets the required functionality. The team tests all features, such as user registration, AI-generated fitness plans, progress tracking, and notifications. If any issues or errors are found, they are identified, recorded and fixed. This process helps improve the performance, stability and user experience of the application before the final release.
