

Requirement Analysis

Requirements

Date	
Team ID	6aba07eeb2817f097462be97
Project Name	FitBuddy – AI Fitness Plan Generator using Gemini Models
Minimum Marks	

Requirements:

Requirements define what FitBuddy should provide to users and what the system needs to achieve its purpose. They can be divided into functional requirements, quality requirements, and system constraints.

1. Functional Requirements

Users can create and manage their fitness profile.

Users can enter their goals, fitness level, preferences, and available workout time.

Gemini generates a customized fitness plan from the entered information.

Users can view daily and weekly workout recommendations.

Users can record completed workouts and monitor their progress.

Users can modify their details and regenerate their fitness plan.

2. Non-Functional Requirements

The application should be simple and easy to navigate.

Fitness plans should be generated within a reasonable response time.

The application should work smoothly on mobile and desktop devices.

User information should be handled securely.

The system should provide consistent and reliable results.

3. System Requirements

Gemini API for AI-based fitness-plan generation.

Frontend for collecting user information and displaying plans.

Backend for processing requests and managing application logic.

Database for storing user profiles and fitness progress.

Internet connectivity for accessing AI services.

Example – Requirements:
